

Biology at Thomas College

[Music]

At Thomas College we just built three brand new science labs and we hopefully have more to come, outfitted with all sorts of cutting-edge equipment that any student would use in any technical professional or research laboratory in the country.

So, our biology major. We try to give students a breadth and depth of experience in biology from cells and molecules to ecology and the outdoors, human health and disease, and everything in between.

We have two tracks: a general biology track for students interested in getting out and doing field work or lab work someday and we also have a pre-professional track that is specially dedicated to students who might want to continue in their education either in graduate school or medical school, veterinary school, PT, things like that.

So, at Thomas we really appreciate that students come to us from a variety expertise and are looking to apply biology to lots of different potential professions in their life and we try to give them that experience through this diverse program.
