

Computer Science at Thomas College

[Music]

I think there's a number of reasons students should choose our program. Several reasons.

So, number one is we're a small program, so personal contact. We have a lot of contacts out there. So, if you're looking for a job, we're very career-focused, we get to know you very quickly, so we can really help you out.

And we're also a teaching college, so even though we do a little bit of research, our focus is primarily on you as the students and helping you learn.

Especially in the computer science degree, the computer information systems degree, and the cybersecurity degree, we do a lot of hands-on things in class. Whether that's IT, so using systems and building systems in class, especially in computer science, we do a lot of programming in there.

We also talk about the business side. So, not only making the IT and using the IT, but how does that actually apply to the business. It really helps students out when it comes to internships and preparing them for their careers.

So, a lot of our students go into software engineering. So, they go into programming, but they also go into IT services. So, they might be system administrators, things like that.

Cybersecurity. We prepare you to be a security analyst. You could be a risk management officer. And then going all the way up to like a CSO. So, being somebody who's actually working with the C-suite for computer information systems.

A lot of the time what we do is we see our students go into IT management. So, they might be again, system administrators. They might go in and actually be systems analysts, so, working more with customers and developing requirements and later down the line, thinking in the future, they might even be enterprise architects.
