

Science Studies at Thomas College

[Music]

In our global sustainability major, that's a bit more of an interdisciplinary major, we see students get a lot of business experience as well as the science experience that they need to really advocate for environmentally sustainable impact in a changing world.

So, we could see them being part of private business and choosing sustainable practices. We could see them advocating for government policies that can help our society move in the right direction sustainability-wise. And then our environmental science and policy major, they can really get a mix of both. So, we've seen students who are interested in writing policy that will advocate for the environment, and they can similarly move into the business space or the government space.

But then we teach them really practical lab skills that they can use to be a part of the scientific community. So, this semester alone we've seen some of our science students working in a water quality testing lab, a soil lab, and a genetic sequencing lab, so they really learn a diverse set of skills that can help them move into any field of science that they choose.
